Paolo Angiolillo

DevOps Engineer

angiolillopaolo@gmail.com | Belgium | https://angiolillo.dev

Profiles

LinkedIn | **Github**

Education

Hogeschool PXL — Applied Information Technology • Bachelor's Degree
Systems and Networks — Belgium, Hasselt • 2015-2020

Experience

VodafoneZiggo — The Netherlands, Maastricht
DevOps Engineer — 2020 - Present

- Owned the lifecycle of a 200+ pod environment. Managed the transition of legacy database clusters into **Docker** containers, optimizing resource density without sacrificing the isolation required for stateful workloads.
- Rebuilt our on-premise Kubernetes control plane from a single-master setup to a multi-master architecture using **Ansible** and **Terraform**. This eliminated our single point of failure
- Used **Terraform, Ansible, and Helm** to move away from "snowflake" servers. Everything is versioned so that a total environment loss is a recovery exercise rather than a forensic investigation.
- Scripting and programming skills in Golang and Python, enabling automation of routine tasks and improving system efficiency.
- Built the CI/CD that get code from a commit to a pod. This included deploying a centralized **Nexus** repository to ensure we aren't pulling external dependencies at runtime—protecting us from upstream outages and keeping builds reproducible.
- Implemented a centralized backup location with scheduled backups using **Ansible**, enabling disaster recovery when data is lost.
- Continuously researching and evaluating new tools and technologies to enhance the DevOps workflow and optimize infrastructure operations.
- Engineered a standardized, cross-platform k3s development environment with a zero-touch automation suite; achieved 100% environment parity across macOS, Linux, and Windows while implementing on-demand networking for dynamic service discovery and resource isolation.
- Moved our core Kubernetes apps to a GitOps workflow using **ArgoCD** and **Helm**. This replaced manual updates with automated deployments that catch "drift", ensuring every change is tracked and human error is minimized.

Ilionx — The Netherlands, Maastricht
DevOps Engineer — 2020 - Present

Gluo — Hasselt, Belgium
Internship — 2020

- Conducted in-depth research on service meshes, including popular frameworks like Istio and Linkerd, evaluating their capabilities, benefits, and integration strategies to improve network communication, service discovery, and observability in microservices architectures.
- Orchestrated the deployment of the research infrastructure utilizing Terraform, seamlessly provisioning and managing cloud resources across both GCP and Azure, ensuring consistent and reproducible infrastructure setups for accurate testing and evaluation.

Skills

DevOps
Ansible, Terraform, Kubernetes, Helm, Jenkins, Linux, Docker, ArgoCD

Programming
Bash, Golang, Python

Languages

Dutch
Native

English
Fluent

Italian
Good

French
Basic
